So now i have to basically have to make the architecture of the website thats bascially the front end. so there are multiple tasks fristly we have to make a layout and design so i can upload my workings on git hub and check my implementation tracker. Then we can get to the coding part of the front end where there has to be functional buttons and woeking website with logo and all. So rn we will just be working with the designing and layout part of it . So the frist pic that i ahve uploaded will be the scroable pop up page in the begining where 5 emotions will be given to choose from . 1- Sad, 2-Happy , 3- Neutral, 4-Exhausted , 5- Angry. And then choosing this emotions will lead us to the next page it should look like pic 2 but with different colors . for 1-#0c0d88,2-#f1bc46,3-#5e08aa,4-#86a896,5-#da553b. and font color shoudl be #f7efcd normally but for 2-#3d0000, so there is more visibility. all the buttons should be functionng and there should be a place for the playlist i mistakenly deleet so i can restore it and also , my playlists, search bar , profile page . use times new roman font and change the size of the font wherever its necessary. The 3rd pic is our logo we need to put that in the top left cornor in a small space , dont make it to big and extarvagent . and the 4th pic is an idea i wanna incorporate as we are going for the vinly astheic so we can have that as a default playlist cover until the user changes it.
